

Blue Horizons Multifunctional Floating Dispenser

Key Features/Characteristics

- 🔑 720g and 1.5kg sizes
- 🔑 Suitable for many different pool sizes.
- 🔑 Slow release sanitiser, clarifier & algaecide
- 🔑 Stabilised to prevent chlorine loss to sunlight
- 🔑 Part of the  System.

Ideal free chlorine range: 1 - 3mg/l (ppm)

Prior to using this product adjust the pH level to the ideal range 7.2 – 7.6.
This floater releases chlorine slowly over a period of 3 to 5 weeks depending on water flow.

Application Instructions

1. Cut the two perforated sections of this label marked with 'scissors-cut'. Choose your setting from a choice of maximum, medium, minimum or small and x small (720g size only) depending on the size of the pool and the chlorine level required. This will expose the holes in the cut out area. If chlorine levels are outside the recommended range of 1-3mg/l, either too high or too low, then adjust the base to expose more or fewer tablets to water flow.
2. Place the floater in an upright position in the pool and hold for a few seconds until the cartridge fills with water before releasing to float on the pool surface.
Do not submerge the dispenser completely and block the vent holes.
3. The dispenser will tip over on its side when the contents have dissolved. A tilting dispenser is an indication that the dispenser will need replacing soon and chlorine level output is reducing.

Note: It is recommended that you periodically (e.g. weekly/fortnightly) shock or oxidise your water, using Blue Horizons Pool Fusion, Granular Shock, Rapid Shock or Shock 'n' Flocc.
